

1 **ABSTRACT OF THE DISCLOSURE**

2 A tail pipe includes a body, two internal fittings and an optional
3 illuminating assembly. The body has an inner passage and two windows defined
4 through the body. Each internal fitting is mounted in the inner passage of the
5 body, and corresponds to one of the windows, and has a side face that faces the
6 window and a protrusion formed from the side face. The protrusions are received
7 in the windows and extend partially out of the window. The illuminating
8 assembly is mounted in the inner passage of the body and has multiple
9 illuminating members to light the internal fittings to be visible in a dark place.
10 Therefore, the internal fittings will provide a decoration for the tail pipe to make
11 that look more attractive and also provide a visible signal to alert someone who
12 is adjacent to the tail pipe to the danger of being burned.
